

## Facts

### Partner\_

Wave Electronics Ltd., Cyprus

### Location\_

Supreme Court of Cyprus, Nicosia

### Control Edition\_

CORTROL Global

### Camera Setup\_

Site uses over 130 cameras spread across site

Physically connected using a Fiber network

*Cyprus although a small island in the Mediterranean, holds great significance in recent times.*

*The district Courts building is located in the judicial complex sharing location with the Supreme Courts and Courts of first instance very close to the city center.*

The project was designed, installed, commissioned and handed over by our local partner Wave Electronics. This project is one among many such similar projects executed by Wave Electronics.

The site comprises over 130 cameras spread across the complex, all networked using fiber optics which is then terminated in a central control room running CORTROL Global. Due to structure of usage, multiple client workstations with CORTROL Client access the video system with different levels of user access.

Mr. Pamboss Charalambous of Wave Electronics commented „The challenge was to integrate several buildings with different layouts, architectures and requirements into one powerful monitoring solution. CORTROL made this job simple while ticking all the boxes“

„With the site being operational now and the users well adept at using CORTROL due to its simplicity, we hope to bring our expertise to other similar projects“ said Mr. George Socratous, Sales Director of Wave Electronics.

CORTOL provides complete situational awareness around the clock with the highest levels of reliability and resilience. With excellent project planning and management skills at Wave Electronics, the project requirements were implemented on the dot with enough system flexibility to allow for changes.
